

Bigger Is Better

Boyd Coddington Wheels 309 Wheels

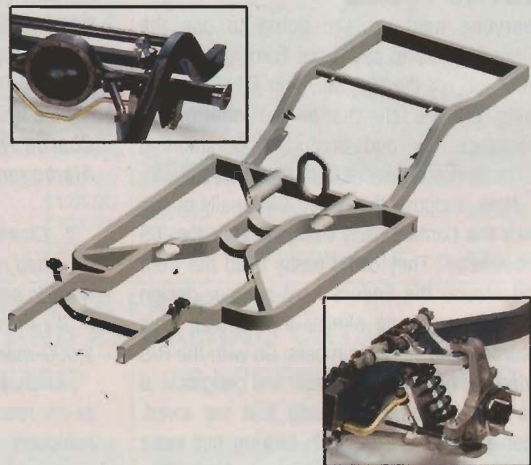

With the known quality of Boyd Coddington, it was only natural for the company to branch out into multi-piece forged territory. The 309 is the latest wheel out of Boyd Coddington's garage. This three-piece rim fits most applications ranging from luxu-barges to performance vehicles, along with many other foreign and domestic cars and trucks. The wheels are available in five- and six-lug versions in sizes ranging from 17 to 20 inches. In addition, brushed, anodized centers, or powdercoated options are also available.

Instant G-Machine

Art Morrison Enterprises MAX-G

Art Morrison Enterprises (AME) makes it easy for anyone with a '60s or '70s musclecar to enjoy the benefits of contemporary suspension technology. AME's new Max-G chassis facilitates turning a unibody-type vehicle into a corner-gripping G-machine. The chassis is CAD-engineered for the specific year, make, and model, and is designed to provide the builder's desired ride height and stance. There's a choice of a C5 Corvette (on some applications) or tubular A-arm front suspension with a triangulated four-bar setup in the rear for both traction control and lateral stability. Special through-frame passage for the exhaust system allows the vehicle to be lower while maintaining ample ground clearance. The frame is precision mandrel-formed from 2x4-inch rectangular tubing and is fixture-welded to ensure proper suspension alignment.
